PS describes the status of symptoms and functions with regard to outpatient status and need for care. PS 0 means normal activity, PS 1 means some symptoms, but still almost completely outpatient, PS 2 means less than 50%, and PS 3 means more than 50% of bed days, while PS 4 means fully bedridden. A PS assessment variability study was conducted among observers to assess undoubted consent between three oncologist evaluating 100 consecutive cancer patients. Full unanimity was observed in 40 cases, unanimity between the two observers in 53 cases and total dissent in seven cases. Kappa statistics reveal the ability of observers compared only to changes and were used to assess an u beyond doubt. Total Kappa was 0.44 (95% confidence limit 0.38-0.51). The PS 0 kappa was 0.55 (0.44-0.67), while ps 1, 2, 3 and four were 0.48 (0.37-0.60), 0.31 (0.19-0.42), 0.43 (0.32-0.55) and 0.33 (0.33-0.45), respectively). If one observer assigned patients to PS 0-2, then the other randomly selected observed patients was placed in the same category with a likely of 0.92. Patients with PS 3-4 were 0.82 per cent more likely to be selected. Overall, the non-doubtful agreement between observers was moderate only when all ecog performance status groups were considered. However, agreement on the distribution of patients to PS 0-2 versus 3-4 was high. This is of interest because this incision is often used in clinical trials.
